

How to Clean a Bridle

After every ride, you'll want to wipe any grime, sweat, saliva and dust from your bridle and reins using either traditional glycerin soap and water or a specially formulated leather cleanser.

Pay particular attention to cleaning areas of your bridle that are typically under pressure during riding and exposed to saliva, such as the ends of cheek pieces and reins where they come in contact with bit rings.

A traditional and economical method—glycerin soap, a small bucket and a sponge or cloth works great. Barely moisten the sponge with cool water. Unfasten hook stud closures and buckles to remove debris caught by the hardware and to smooth creases in your leather.

After washing, and when the leather feels smooth and clean, rub a nearly dry sponge or rag against the glycerin soap bar. Apply a thin layer of glycerin soap (no suds during this step) to your leather to seal its pores and keep it soft, but not sticky.

Wash the bit in warm water. If available, use a scrubber sponge or designated brush (not glycerin soap sponge) to remove dirt and grime from bit.

Check bridle for any cracked
or damaged leather.

Send out for repair if you find
any damage.

Safety first!

Now figure 8 your
bridle and put it away.
